REC\_DS using C\_Week 7\_COD\_Question 3

Attempt : 1 Total Mark : 10 Marks Obtained : 10

Section 1: Coding

#### 1. Problem Statement

In a messaging application, users maintain a contact list with names and corresponding phone numbers. Develop a program to manage this contact list using a dictionary implemented with hashing.

The program allows users to add contacts, delete contacts, and check if a specific contact exists. Additionally, it provides an option to print the contact list in the order of insertion.

## **Input Format**

The first line consists of an integer n, representing the number of contact pairs to be inserted.

Each of the next n lines consists of two strings separated by a space: the name of the contact (key) and the corresponding phone number (value).

The last line contains a string k, representing the contact to be checked or removed.

#### **Output Format**

If the given contact exists in the dictionary:

- 1. The first line prints "The given key is removed!" after removing it.
- 2. The next n 1 lines print the updated contact list in the format: "Key: X; Value: Y" where X represents the contact's name and Y represents the phone number.

If the given contact does not exist in the dictionary:

- 1. The first line prints "The given key is not found!".
- 2. The next n lines print the original contact list in the format: "Key: X; Value: Y" where X represents the contact's name and Y represents the phone number.

Refer to the sample outputs for the formatting specifications.

## Sample Test Case

Input: 3 Alice 1234567890 Bob 9876543210 Charlie 4567890123 Bob

> Output: The given key is removed! Key: Alice; Value: 1234567890 Key: Charlie; Value: 4567890123

#### **Answer**

```
// You are using GCC
void insertKeyValuePair(Dictionary *dict, const char *key, const char *value) {
   if (dict->size >= dict->capacity) {
      dict->capacity *= 2;
      dict->pairs = (KeyValuePair *)realloc(dict->pairs, dict->capacity *
   sizeof(KeyValuePair));
```

```
strcpy(dict->pairs[dict->size].key, key);
  strcpy(dict->pairs[dict->size].value, value);
  dict->size++;
void removeKeyValuePair(Dictionary *dict, const char *key) {
  int found = 0;
  for (int i = 0; i < dict->size; i++) {
    if (strcmp(dict->pairs[i].key, key) == 0) {
       found = 1:
       for (int j = i; j < dict > size - 1; j++) {
         dict->pairs[j] = dict->pairs[j + 1];
       dict->size--;
       break;
int doesKeyExist(Dictionary *dict, const char *key) {
  for (int i = 0; i < dict -> size; i++) {
    if (strcmp(dict->pairs[i].key, key) == 0) {
       return 1;
    }
  return 0;
void printDictionary(Dictionary *dict) {
  for (int i = 0; i < dict->size; i++) {
    printf("Key: %s; Value: %s\n", dict->pairs[i].key, dict->pairs[i].value);
  }
}
                                                                           Marks: 10/10
Status: Correct
```
